

Preliminary Report (20 %)

Software Requirements and Preliminary Prototype

Task

The Preliminary Report will focus on your ability to apply the “Ideate” step to the problem (are you able to ideate the solution successfully?) from an end-user perspective. This must be done before you can start any prototyping. Once you arrive at your proposed solution, you will start to flesh out your solution with user stories (based on your user research and personas!). This is where you will produce some high-level requirements, using epics broken down into user stories and associated acceptance criteria.

You need to have:

- (i) Thoroughly identified required features based on your previously specified problem statements;
- (ii) Effectively understood and described these features using user-stories and acceptance criteria;

This means that your Preliminary Report will have all of your epics and user stories (and associated acceptance criteria) as a product backlog in JIRA. Your epics should be separated into user stories for easier sprint planning. As part of your deliverable, you will prepare:

- 1) At least two epics with associated user stories and acceptance criteria;
- 2) First pass user story mapping to show your first sprint;
- 3) Preliminary prototype to address the prepared user stories.

Your preliminary prototype will likely be in the low fidelity stages. You are free to choose your prototyping tools, in-built support for Figma is provided in JIRA. Some other prototyping tools were discussed in the Week 4 Lecture. The prototype must have a clear demonstration of key paths (main features based on your first mapped sprint).

Guidance for your report:

- 1) Address the above task as best as possible – make sure you have clear justifications for your decisions – this is where all that wonderful user research comes into play! Therefore, begin by demonstrating your use of ideation tools and techniques to come up with several ideas based on your problem definition.

- 2) Clearly show your process of taking ideas from ideation activities into user stories (did you translate them all? Did you prioritise them to focus on what might be most achievable in the time frame? How did you prioritise?)
- 3) Make sure you clearly show any user story dependencies, and it is clear how your user stories are addressing your identified problem. You must have a minimum of two epics, with associated user stories (this number may vary based on the context of your themes, initiatives and epics). Each user story should have associated acceptance criteria attached to them.
- 4) Look for opportunities to build on concepts taught in class and workshop activities
- 5) Ensure the preliminary prototype is clearly related to user stories

Table 1 Summary of crucial assessment details

Type	Group
Submission	JIRA with associated Confluence documentation (as needed) and prototypes
Due date	11 PM, Friday 17th July (Week 7)
Weighting	20%
Word limit	At least two epics broken down into user stories
Marking	Marked by demonstrators and moderated by coordinators (on Moodle)
Team evaluation	By default all marks are unmoderated. More details on team evaluation will be released.
Penalties	-5% of max mark per day for late submissions (no submissions will be accepted after 5 days)

Submission

Submission via JIRA and Confluence (as needed), and any associated prototypes included also.

Marking

The assessment will be marked by your course demonstrator and moderated by course coordinators. The marker is your workshop demonstrator. The submission is worth 20% of your final grade. Marks and feedback will be returned within two weeks of submission. The marking rubric outlines how your interim report will be marked. Please read it and the rest of this guide carefully.

	0	0.5	1	2	3
User Stories and Acceptance Criteria					
User Stories are clearly related to problem solution	No		Somewhat	Yes	
User stories presented in the right format and add value to the epic	No		Somewhat	Yes	
Clear acceptance criteria for each user story sets the skeleton for testing	No		Somewhat	Yes	
Functional and Non-Functional requirements considered for user stories are logical and correctly classified	No		Somewhat	Yes	
Acceptance criteria is measurable and testable	No		Somewhat	Yes	
Shows a clear and high quality definition of requirements through user stories	No		Somewhat	Yes	
Shows a clear and high quality acceptance criteria	No		Somewhat	Yes	
User story mapping shows clearly a well-defined first sprint	No		Somewhat	Yes	
Dependencies within user stories are clearly demonstrated	No		Somewhat	Yes	
Preliminary Prototype					
Prototype clearly relates to user stories	No		Somewhat		Yes
Prototype is of appropriate fidelity in relation to stage of design process	No		Somewhat		Yes
Prototype can be used to test features demonstrated through deliverable's user stories	No		Somewhat		Yes
Overall quality and appropriateness of preliminary prototype	Low		Average		High

Presentation					
At least two epics Clear and concise language used for user stories and acceptance criteria Overall high quality	No		Somewhat		Yes
